

WHAT IS CLAIMED IS:

1. A method in a signal processor for quantizing a digital signal, the method comprising:
 - generating a fixed-point approximation of a value $X \div D$, wherein X is a fixed-point value based on one or more samples in the digital signal, and wherein D is a fixed-point quantization parameter;
 - generating a correction; and
 - modifying the approximation with the correction.

2. The method of claim 1, wherein generating the approximation includes multiplying X by D' , wherein D' is $2^n/D$, wherein n is a positive integer such that $2^n > D$.

3. The method of claim 2, wherein n is selected from a group consisting of 8, 16, 32, 64 and 128.

4. The method of claim 2, wherein generating the correction includes multiplying X by DR, wherein DR is $((2^n + k \cdot (D/2))/D) \cdot (2^n \% D)$, wherein k is a non-negative integer.

5. The method of claim 4, wherein X is based on a DCT coefficient.

6. The method of claim 5, wherein X is based on an absolute value of the DCT coefficient.

7. The method of claim 5, wherein $X = X' + D \gg 1$, wherein X' is a fixed-point value based on a DCT coefficient, and wherein D is a quantization scale.

8. The method of claim 5, wherein $X = X' + D2 \gg 1$, wherein X' is a fixed-point value based on a DCT coefficient, and wherein $D2$ is another quantization parameter.

9. The method of claim 5, wherein $D = 2 * Q$, wherein D' is $2^{n-1} / Q$, wherein DR is $((2^n + k * (Q/2)) / Q) * (2^{n-1} \% Q)$, and wherein Q is a quantization scale.

10. The method of claim 9, wherein $X = X' + (3*Q + 2) \gg 2$, wherein X' is a fixed-point value based on a DCT coefficient.

10010674-13001

1 11. The method of claim 9, wherein X is the maximum of zero and $(X' -$
2 $Q/2)$, wherein X' is a fixed-point value based on a DCT coefficient.

1 12. The method of claim 4, wherein modifying the approximation with the
2 correction includes adding the approximation with the correction.

1 13. The method of claim 12, wherein n is a word length, wherein the
2 approximation includes a most significant word (MSW(approximation)) and a least
3 significant word (LSW(approximation)), wherein the correction includes a most significant
4 word (MSW(correction)), and wherein adding the approximation with the correction
5 includes:

6 adding MSW(correction) with LSW(approximation) to produce a sum;
7 right-shifting the sum by n bits; and
8 adding the sum with MSW(approximation).

1 14. The method of claim 13, wherein the signal processor is a
2 microprocessor having an instruction for calculating a function $(A+B+1) \gg 1$, and wherein
3 the step of adding MSW(correction) with LSW(approximation) and the step of right-shifting
4 the sum by n bits include:

5 calculating $(MSW(correction) + LSW(approximation) + 1 \gg 1)$ using the
6 instruction; and
7 right-shifting $(MSW(correction) + LSW(approximation) + 1 \gg 1)$ by n-1 bits.

1 15. The method of claim 14, wherein the microprocessor is an IntelTM
2 microprocessor with MMXTM technology, and wherein the instruction is the pavgw
3 instruction.

1 16. The method of claim 1, further including:
2 generating X, wherein $X = 16 * ABS(X')$, wherein X' is a fixed-point value
3 based on a DCT coefficient, and wherein D is a quantization step.

1 17. The method of claim 1, further including:
2 generating X, wherein $X = 32 * ABS(X')$, wherein X' is a fixed-point value
3 based on a DCT coefficient, and wherein D is a quantization step.

1 18. The method of claim 17, wherein generating X includes generating X"
2 = 16*ABS(X').

1 19. The method of claim 1, further including:
2 generating X, wherein $X = 32 * \text{ABS}(X') + \text{SGN}(X') * (D \gg 1)$, wherein X' is a
3 fixed-point value based on a DCT coefficient, and wherein D is a quantization step.

1 20. The method of claim 19, wherein generating X includes generating X"
2 = 16*ABS(X') + SGN(X')*(D>>2).

1 21. The method of claim 20, wherein n is a word length, and wherein
2 generating the approximation includes:
3 multiplying X'' by D' to produce a most significant word of X''*D'
4 (MSW(X''*D')) and a least significant word of X''*D' (LSW(X''*D')), wherein D' is $2^n/D$,
5 wherein n is a positive integer such that $2^n > D$.

1 22. The method of claim 21, wherein generating the approximation further
2 includes:
3 left-shifting MSW(X''*D') by one bit to produce $\text{MSW}(X''*D') \ll 1$;
4 right shifting LSW(X''*D') by 15 bits to produce $\text{LSW}(X''*D') \gg 15$; and
5 bit-wise ORing $\text{MSW}(X''*D') \ll 1$ with $\text{LSW}(X''*D') \gg 15$.

1 23. The method of claim 21, wherein generating the correction includes:
2 multiplying X'' by DR to produce a most significant word of X''*DR
3 (MSW(X''*DR)), wherein DR is $((2^n + k*(D/2))/D) * (2^n \% D)$, wherein k is a non-negative
4 integer.
number. cc 11/28/01

1 24. The method of claim 23, wherein the step of adding the approximation
2 with the correction includes:
3 left-shifting LSW(X''*D') by one bit to produce $\text{LSW}(X''*D') \ll 1$;
4 left-shifting MSW(X''*DR) by one bit to produce $\text{MSW}(X''*DR) \ll 1$;
5 adding $\text{LSW}(X''*D') \ll 1$ with $\text{MSW}(X''*DR) \ll 1$ to produce a sum;
6 right-shifting the sum by n bits; and
7 adding the sum with the bit-wise OR of $\text{MSW}(X''*D') \ll 1$ with
8 $\text{LSW}(X''*D') \gg 15$.

1 25. The method of claim 24, further including, prior to the step of right-
2 shifting the sum, adding D' to the sum if $D \gg 1$ is odd.

1 26. The method of claim 25, wherein the signal processor is a
2 microprocessor having an instruction for calculating the function $(A+B+1) \gg 1$, and wherein
3 the steps of adding $LSW(X''D') \ll 1$ with $MSW(X''DR) \ll 1$, adding D' to the sum, and
4 right-shifting the sum by n bits include:

5 generating $sum = (LSW(X''D') \ll 1 + MSW(X''DR) \ll 1 + 1) \gg 1$ using the
6 instruction;

7 generating $sum = (sum + (D'/2) + 1) \gg 1$ using the instruction; and
8 right-shifting the sum by n-2 bits.

1 27. The method of claim 26, wherein the microprocessor is an IntelTM
2 microprocessor with MMXTM technology, and wherein the instruction is the pavgw
3 instruction.

1 28. The method of claim 1, wherein X is based on a DCT coefficient.

1 29. The method of claim 1, wherein X is based on an audio sample.

1 30. The method of claim 1, wherein X is based on a sample of a
2 communications signal.

1 31. A computer program product comprising:
2 a computer readable storage medium having computer program code
3 embodied therein for quantizing a digital signal, the computer program code comprising:
4 code for generating a fixed-point approximation of a value $X \div D$, wherein X is
5 a fixed-point value based on one or more samples in the digital signal, and wherein D is a
6 fixed-point quantization parameter;
7 code for generating a correction; and
8 code modifying the approximation with the correction.

1 32. A system for quantizing a digital signal, the system comprising:
2 a memory that stores a fixed point value X based on one or more samples in
3 the digital signal; and
4 a processor coupled to the memory and operable to perform the steps of:

- 5 A) generating a fixed-point approximation of a value $X \div D$, wherein D
- 6 is a fixed-point quantization parameter;
- 7 B) generating a correction; and
- 8 C) modifying the approximation with the correction.

1 33. A method in a signal processor for quantizing a digital signal, the
 2 method comprising:
 3 generating a fixed-point approximation X1 of a value X/W , wherein X is a
 4 fixed-point value based on one or more samples in the digital signal, and wherein W is a first
 5 fixed-point quantization parameter;
 6 generating a first correction;
 7 modifying X1 with the correction to produce a fixed-point value X2;
 8 generating a fixed point approximation X3 of a value $X2 \div (2 \cdot Q)$, wherein Q is
 9 a second fixed-point quantization parameter;
 10 generating a second correction; and
 11 modifying X3 with the correction.
